

Built for CROs & Testing Labs Whose Reports Become Someone Else's Evidence

Contract Research Organizations (CROs) and testing labs produce the evidence their clients submit to regulators. Study reports, protocol documentation, deviation records, and validation packages, whether that's a biocompatibility panel run under ISO 10993 or a sterilization validation study, have to be consistent across studies, analysts, and years. Pensato embeds your institutional knowledge directly into those workflows, so quality holds at volume, across a growing sponsor roster, and turnaround time stops competing with rigor.

Where AI Changes How A CRO Operates

Report templating and document search are the starting point. The deeper opportunity is the review and assembly work that sits between study completion and client delivery, where senior scientific staff spend time on verification rather than on science. Use cases include:

- Study Report Assembly & Internal QC Review
- Protocol Deviation Documentation & Justification
- Cross-Study Consistency & Methods Alignment
- Test Method Validation Documentation
- Sponsor Audit & Query Response
- Standard Operating Procedure Change Impact Assessment

How It Works

- 1 EMBED:** Your methods, prior study records, and quality documentation become part of a local and secure intelligence layer.
- 2 SURFACE:** When staff need a prior report structure, a deviation justification, or a validation precedent, it is surfaced inline.
- 3 VERIFY:** Every output ties back to its source document, so review means confirmation, not reconstruction.

Why Pensato

We create a secure intelligence layer that embeds your methods, prior study records, and quality documentation directly into AI workloads. Client confidentiality is structural in this business. The same layer that makes your institutional knowledge usable also keeps each client's work separated. The result is deliverables that read the same way regardless of which analyst prepared them, and a review process that starts from a traceable source.

What Your Team Gains

Embedded Intelligence

Organizational context is embedded directly into document workflows.

Deterministic Outputs

Same document, same query, same answer. Output tied to source data.

No Prompting

Document Management System surfaces intelligence native to the workflow.

Source Linked Trail

Every output traces back to its source document, so internal review starts from confirmation.

Contract research organizations and testing laboratories operate inside their clients' regulatory exposure. A study report becomes part of a submission, an audit response, or a design and development file that the sponsor has to defend.

Pensato embeds your organizational knowledge into AI workloads without moving or exposing it, and every output stays tied to the source document it came from. When a sponsor or an internal reviewer asks how a conclusion was reached, the answer is already in the record.

Ready to move AI from the cloud to the core of your business? Book a Guided Session.
